

Geode Software Project Profile Case Management System

Industry

State Agency

Need

The client was allocated several new programs by the State of Connecticut. They needed to have support for the parameters of the new program added to their existing software which had been written by a company that went out of business.

Challenges

- The client's software had been developed by a company that has gone out of business
- The actual details of the program would not be fully known until shortly before the software needed to be in operation
- Limitations in the software's original design made adding new features very cumbersome

Solution Type

Client/Server Application

Solution

Geode created a parallel set of modules for the client's existing applications. The new modules incorporated screens and reports that provided support for the new programs as well as created a more extensible platform for future modification.

Result

By dividing the project into smaller segments, Geode was able to deliver software as the full needs of the programs were finalized and as the client need for the features arose. The new software modules allow the client to successfully manage the new programs that were added to their roster and maintain their existing set of programs.
